

Twenty × AI: agents as a CRM primitive — 7 grounded moves (2026-07-04)

TL;DR

- The defining trend for Twenty this week: AI agents are becoming a built-in CRM primitive across open-source GTM tools (Auxx.ai, Budibase, DenchClaw), and the Model Context Protocol (MCP) is emerging as the integration substrate agents use to read/write apps.
- Top realistic move: ship a first-party MCP server that wraps Twenty's existing GraphQL API, so any agent (Claude, Cursor, internal) can query and update the CRM — table-stakes fast.
- Top chaos play: become the open, self-hostable CRM data-plane that any third-party agent plugs into via MCP — the anti-Agentforce, positioned exactly where the incumbent-disruption narrative is loudest.

SCOREBOARD

CODE	TITLE	F	E	I	D	STAGE
[A1]	Ship a first-party MCP server that exposes Twenty to any agent	5	4	4	2	
[A2]	In-Postgres AI enrichment as a workflow action ('Enrich this record')	4	4	4	2	
[A3]	Agent-native views: natural language → saved View (text-to-CRM-query)	4	3	4	2	
[A4]	Publish an 'AI account manager' starter app via create-twenty-app	4	4	3	2	
[B1]	Salesforce-migration agent — one-click importer + AI schema re-modeler	3	3	4	3	
[B2]	Open CRM data-plane — bring-your-own-agent via MCP (anti-Agentforce)	2	3	5	4	
[B3]	System of record → open 'system of agents' (identity pivot)	3	4	5	5	

○○○○ [A1] Level 2 — Adjacent

Ship a first-party MCP server that exposes Twenty to any agent

Wrap Twenty's existing GraphQL API as a Model Context Protocol server so any MCP-capable agent can search records, read objects, and (gated) write updates. This turns the 'designed for AI' claim into a concrete, standards-based surface and rides the fastest-moving integration trend without new infra.

FEASIBILITY ☒ ☒ ☒ ☒ ☒ EVIDENCE ☒ ☒ ☒ ☒ ☐ IMPACT ☒ ☒ ☒ ☒ ☐

DISRUPTION ☒ ☒ ☐ ☐ ☐ ☐

Why now: [Airweave \(YC X25\): 'let agents search any app'](#), [PolyMCP: MCP tools + autonomous agents + orchestration](#)

Why us: [Tech stack: GraphQL API on NestJS/TypeScript \(README Stack\)](#), [Stated strategy: 'designed for AI', agents as a primitive](#)

First testable step: In 2 weeks: build a read-only MCP server wrapping the GraphQL API (tools: search_records, get_object, list_views), dogfood it in Cursor/Claude, and open a PR to modelcontextprotocol/servers with Twenty listed.

Fig. 1 — larva

○○○○ [A2] Level 2 — Adjacent

In-Postgres AI enrichment as a workflow action ('Enrich this record')

Add an 'Enrich' workflow action that uses an LLM to fill missing company/contact fields from public data and writes back to the Postgres row. Enrichment is a core CRM job being re-platformed onto agents + the database — and Twenty already runs on Postgres, so this is differentiated and native rather than a third-party bolt-on.

FEASIBILITY ☒ ☒ ☒ ☒ ☐ EVIDENCE ☒ ☒ ☒ ☒ ☐ IMPACT ☒ ☒ ☒ ☒ ☐

DISRUPTION ☒ ☒ ☐ ☐ ☐ ☐

Why now: [PgCortex: AI enrichment per Postgres row, zero txn blocking](#), [Show HN: Clay-like enrichment in Google Sheets](#)

Why us: [Tech stack: PostgreSQL backend \(README Stack\)](#), [Offering: workflows are a core building block](#)

First testable step: Ship a flagged 'Enrich' action on the Company object: on trigger, an LLM proposes values for empty fields with source links; a human approves before write-back. Measure fill-rate and correction rate on 50 records.

Fig. 2 — larva

🔗 [A3] Level 2 — Adjacent

Agent-native views: natural language → saved View (text-to-CRM-query)

Add an 'Ask' command that turns a plain-English question ('deals closing this month with no activity in 14 days') into a saved View via GraphQL filters — not free-form SQL. Views are already a core primitive; this makes them conversational and matches how practitioners are starting to drive their CRM by prompt.

FEASIBILITY ☒☒☒☒☐ EVIDENCE ☒☒☒☐☐ IMPACT ☒☒☒☒☐
DISRUPTION ☒☒☐☐☐☐

Why now: [Ask HN: an AI agent running CRM follow-ups in prod \(200 msg\)](#), [Airweave: agents searching across app data](#)

Why us: [Offering: views are a core building block extended as code](#), [Tech stack: GraphQL filter layer already exists](#)

First testable step: Ship a read-only 'Ask' palette that maps a question to GraphQL view filters and previews the result set before saving. Constrain to existing fields/operators (no raw SQL) to keep it safe.

🔗 [A4] Level 2 — Adjacent

Publish an 'AI account manager' starter app via create-twenty-app

Ship an official example app that drafts follow-ups and logs activities for stale deals, scaffolded with create-twenty-app. It showcases the apps SDK and agents primitive with a use case the market has already validated commercially, and gives developers a copyable pattern.

FEASIBILITY ☒☒☒☒☐ EVIDENCE ☒☒☒☒☐ IMPACT ☒☒☒☐☐
DISRUPTION ☒☒☐☐☐☐

Why now: [Gradient Labs: an AI account manager per bank customer](#), [Parloa: service agents customers want to talk to](#)

Why us: [Differentiator: apps SDK + create-twenty-app \(CRM-as-code\)](#), [Stated strategy: agents as a first-class primitive](#)

First testable step: Scaffold a `create-twenty-app` template 'deal-nudger': finds deals with no activity in N days, drafts a follow-up email, and logs a task. Ship it as a documented example app in the developer docs.

Fig. 4 — larva

TRACK B — CHAOS / METAMORPHOSIS

[B1] Level 3 — New line · product/feature bet — reversible

Salesforce-migration agent — one-click importer + AI schema re-modeler

Meet the incumbent-disruption moment head-on: an agent that ingests a Salesforce export, proposes a Twenty object/field schema (CRM-as-code), and generates the migration — turning 'I want off Salesforce' into a guided afternoon. This weaponizes CRM-as-code as an acquisition wedge.

FEASIBILITY  EVIDENCE  IMPACT 

DISRUPTION 

Why now: [HN: 'Salesforce, SAP, or ServiceNow — which is ripe for disruption?'](#), [Ask HN: how to sell SaaS without AI features in 2026?](#)

Why us: [Differentiator: define objects/fields/views as code \(twenty-sdk\)](#), [Users: technical teams who build/version their CRM like code](#)

Metamorphosis narrative: Product/feature bet: an agent maps a Salesforce export onto Twenty's code-defined objects and emits the migration as reviewable, versioned code rather than an opaque import. Scoped to one acquisition surface — reversible, doesn't touch the core product's identity.

Kill criteria: If beta migration completion rate stays below ~40% (users abandon mid-flow), narrow scope to data-only import and drop the schema re-modeling agent.

Fig. 5 — chrysalis

[B2] Level 4 — Model shift · line-of-business / model bet

Open CRM data-plane — bring-your-own-agent via MCP (anti-Agentforce)

Publish a stable MCP contract and position Twenty as the open, self-hostable data-plane that any third party's agents plug into — the opposite of Salesforce Agentforce's walled garden. Competitors monetize a closed agent runtime; Twenty wins by being the neutral, ownable substrate agents build on.

FEASIBILITY  EVIDENCE  IMPACT 
DISRUPTION 

Why now: [Airweave: 'let agents search any app' \(BYO-agent demand\)](#), [PolyMCP: MCP tooling + orchestration momentum](#)

Why us: [Business model: OSS core + free self-host \(ownable, neutral\)](#), [Tech stack: GraphQL API to expose as an open MCP contract](#)

Metamorphosis narrative: Line-of-business / model bet: harden the first-party MCP server (A1) into a versioned public contract so external agent platforms treat a self-hosted Twenty as their CRM backend. This adds an open-substrate line of business and shifts GTM — a model bet, not a company teardown.

Kill criteria: If no third-party agent platform integrates against the published MCP contract within two quarters, fold the effort back into first-party-only use (A1) and drop the marketplace framing.

Fig. 6 — emergence

[B3] Level 5 — Metamorphosis · bet-the-company

System of record → open 'system of agents' (identity pivot)

Reframe Twenty so every object can be assigned an agent workforce that does the work (enrich, follow up, summarize, route), with the record as the audit trail rather than the product. The CRM stops being a database you fill in and becomes a team you manage — the boldest expression of 'designed for AI', done in the open.

FEASIBILITY  EVIDENCE  IMPACT 
DISRUPTION 

Why now: [Parloa: service agents customers want to talk to](#), [Budibase Agents: model-agnostic agents for internal workflows](#), [Netomi: scaling agentic systems into the enterprise](#)

Why us: [Stated strategy: agents as a first-class CRM primitive](#), [Differentiator: CRM-as-code \(objects/views/workflows as code\)](#)

Metamorphosis narrative: Bet-the-company: make an assignable agent the default unit of work on every object, with the record demoted to the audit log. Twenty stops being a database you fill in and becomes a team you manage — the single identity-level pivot here, only worth it if agent-native signal holds.

Kill criteria: If fewer than ~15% of active workspaces assign at least one agent to an object within two quarters of GA, revert to agents-as-feature and stop the reframe.

Fig. 7 — imago

DEEP DIVE — DIGEST THEMES

Open-source CRMs are converging on 'AI-agent-native'

The OSS CRM/GTM category is racing to make AI agents a built-in primitive, not an add-on — exactly Twenty's stated posture, now contested by newer entrants like Auxx.ai, Budibase Agents, and DenchClaw.

Sources: [DenchClaw — local CRM on an agent runtime](#), [Auxx.ai — support CRM = 'Attio + n8n'](#), [Budibase Agents \(Beta\)](#).

MCP is becoming the integration substrate for agents

The Model Context Protocol is emerging as the standard way agents read/write external apps. For a CRM, being an MCP server (expose data) and host (reach tools) is fast becoming table stakes.

Sources: [Airweave — let agents search any app](#), [PolyMCP — MCP tools + orchestration](#), [Hugging Face MCP Server](#)

Data enrichment is being re-platformed onto agents + Postgres

Contact/company enrichment — a core CRM job — is shifting from third-party APIs (Clearbit/Apollo) toward agentic + in-database approaches. Twenty runs on PostgreSQL, so in-row enrichment is a natural, differentiated surface.

Sources: [PgCortex — AI enrichment per Postgres row](#), [Clay-like enrichment in Google Sheets \(Show HN\)](#), [AgentWeb — business directory API for agents](#)

Enterprises are operationalizing agentic customer-facing work

The clearest revenue proof points are customer-facing agents (support, account management), validating a 'CRM that does the work, not just stores it' direction.

Sources: [Netomi — scaling agentic systems in the enterprise](#), [Gradient Labs — an AI account manager per customer](#), [Parloa — service agents customers want to talk to](#)

The incumbent-disruption narrative is loud — open/AI-native is the wedge

Market discourse explicitly asks which system-of-record incumbents fall first and whether non-AI SaaS is sellable — a tailwind for an open, AI-native CRM.
